Morbidity and Mortality

Weekly
Report

U. S. DEPARTMENT OF HEALTH, EDUCATION, AND WELFARE
PUBLIC HEALTH SERVICE

Prepared by the **COMMUNICABLE DISEASE CENTER** MEIrose 4-5131

For release June 8, 1962

ATLANTA 22, GEORGIA

Vol. 11, No. 22

PROVISIONAL INFORMATION ON SELECTED NOTIFIABLE DISEASES IN THE UNITED STATES AND ON DEATHS IN SELECTED CITIES FOR WEEK ENDED JUNE 2, 1962

POLIOMYELITIS - During the current week, Texas again dominated the national reporting of poliomyelitis with 9 cases, 8 paralytic. Only 2 other cases, both paralytic, were recorded in the country.

This week 5 counties from Texas reported one case each while Frio County reported 4 cases. These four cases occurred in the small town of Dilley (population 2,100) located between San Antonio and Laredo in South Texas. All had onsets of illness during the last week in May and two of the four cases were fatal. This situation was first brought to the attention of the Texas State Health Department on May 30. By the evening of May 31, the entire population of the town had been immunized with Type I oral polio vaccine.

Of the 109 cases in the U. S. with 1962 onsets, 45 have been reported from Texas. These are localized to the South Texas counties of Bexar, Webb, Hidalgo, and Frio, as shown below:

Poliomyelitis in Texas in 1962

Texas Counties	Paralytic	Non-Paralytic	Total
Bexar	10	2	12
Webb	8	0	8
Hidalgo	4	0	4
Frio	4	0	4
Others	13	4	17
Total	39	6	45

Malaria: Fla. - 1	Smallpox:
Plague:	Typhus, murine:

REPORTED CASES OF MEASLES IN U. S. by year, 1951 - 1961

Mass immunization programs have recently been completed in San Antonio, Bexar County, where 589,000 doses of Type I oral vaccine were given and in Laredo, Webb County, where 62,000 doses were administered.

HEPATITIS - The number of hepatitis cases reported for the 22nd week ending June 2 fell abruptly to 906 from the previous week's report of 1,098. The hepatitis cases reported for this week represent the smallest number reported since the 905 cases for the week ending December 31, 1960.

The cumulative totals for the first 22 weeks of 1962 and the previous 4 years are shown below:

1962	1961	1960	1959	1958
28,223	38,096	17,179	10,666	7,279

MEASLES - Approximately 370,000 cases of measles have been reported during the first 22 weeks of 1962. Although this is somewhat higher than for the comparable period last year, it is still lower than might be expected from analysis of the pattern over the last ten years. During this span, the annual number of cases occurring over the nation exceeded 600,000 during 1952, 1954, 1956, and 1958, while the intervening years maintained an average close to 500,000 cases. Since 1959, the annual case incidence has remained under 450,000. It is expected that approximately 500,000 cases will be reported in 1962.

EPIDEMIOLOGICAL REPORTS

Rickettsialpox - Massachusetts

A 47-year-old salesman was admitted to a Massachusetts hospital on March 26 with a complaint of a fever of unknown origin. About 10 days prior to admission, on March 15 or 16, the patient noted a pimple on the medial aspect of his right lower leg. A day or two later the patient began having chills and fever which subsequently recurred each afternoon. On the 22nd of March the patient noticed several small red spots on his arms. More appeared over the next few days. The original leg lesion also became larger. Temperature taken during a severe chill on the afternoon of March 23 was 103° F.

The patient had been in Pittsburgh, Pennsylvania on business from March 4 through March 9. In the course of his trip he cleaned a rug for his exhibition booth. While he was removing excelsior from the rug, his pants rose exposing the skin of his leg for a small area above his sock. This was approximately the area of skin where the original lesion developed. A mouse had been seen in his room at about that time though the patient could not recall a mite bite.

A complement fixation test with grouped rickettsial antigen containing predominantly *Rickettsia akari* was positive in a 1:10 dilution. This, along with clinical data, was thought to be highly suggestive of a diagnosis of

rickettsialpox. The patient was discharged, improved on Chloramphenicol therapy.

(Reported by Joseph P. Reardon, Epidemiologist, Division of Communicable Diseases, Department of Public Health, Massachusetts.)

Editor's Note:

Rickettsialpox was first recognized and reported following an outbreak in 1946 in New York City. Additional cases of rickettsialpox were reported from 1946-1956 from a relatively few areas in the United States including New York City, Boston, Philadelphia, Cleveland, and West Hartford, Connecticut.

The vector of the disease, the mouse mite *Allodermanyssus sanguineus*, has been found in a number of areas including Washington, D. C., New York City, Boston, Champaign, Illinois, Salt Lake City, and West Hartford, Connecticut.

If the exposure in the case reported above did indeed

occur in Pittsburgh, this adds another U.S. city to the five where rickettsialpox has occurred.

Hospital-Related Staphylococcus Infection - Ohio

Over the past several years, the Ohio Department of Health, in cooperation with several local health departments, has studied the problem of hospital-related staphylococcal infections. Arrangements were made with several health departments for nursing visits to obtain data from persons with lesions from which staphylococcus type 80/81 was isolated. These visits were made 2 to 16 weeks (usually 3 to 4 weeks) after the onset of illness in the index case. Cases were called hospital-related if the patient or family member had been hospitalized within a six month period prior to the onset of the staphylococcal disease, or if the disease had developed during hospitalization. As shown in the following table, approximately 60% of staphy-

(Continued on page 176)

SUMMARY OF PNEUMONIA AND INFLUENZA DEATHS

The weekly average number of pneumonia-influenza deaths for the four-week period ending June 2 was 424 as compared with an expected 422 weekly average.

	WEEK ENDING				4 Week Total	Weekly Average
	5/12	5/19	5/26	6/2

* Current Week Mortality for 108 Selected Cities

4(A) Total Mortality, all ages..... 10,443
 4(B) Pneumonia-Influenza Deaths, all ages..... 386
 4(C) Total Deaths under 1 Year of Age..... 665
 4(D) Total Deaths, Persons 65 years and over..... 5,823

*Estimate - based on average percent of divisional total
 Totals for previous weeks include reported corrections.

NOTE: All deaths by place of occurrence.

lococcal illnesses type 80/81 could be considered hospital related:

RELATIONSHIP OF INFECTION OF PATIENTS WITH
STAPHYLOCOCCAL DISEASE, TYPE 80/81

City	Time of Survey	Number of Patients	Community Related	Hospital Related	Percent Hospital Related
Cincinnati	1959-61	237	99	138	58%
Toledo	1959-60	66	20	46	70%
Dayton	1958-59	17	4	13	76%
Lima	1958-59	20	3	17	85%
TOTAL		340	126	214	63%

The percent of hospital-related infections by age group is shown for 237 Cincinnati patients investigated from July, 1959, through March, 1961:

AGE OF PATIENT AND HOSPITAL RELATIONSHIP OF
STAPHYLOCOCCUS TYPE 80/81 DISEASE, CINCINNATI, OHIO
JULY 1959 - MARCH 1961

Age of Patient	No. of Patients	% With Relationship to Hospital
0 - 1	33	100%
1 - 5	50	38%
6 - 19	36	36%
20 - 39	53	55%
40 - 59	32	59%
60 and over	33	76%
TOTAL	237	58%

The table below summarizes the risk to household members of developing staphylococcal disease following the occurrence of the first case in the household. The secondary attack rates ranged from 9 to 18 percent with an average of approximately 10%.

SECONDARY CASES IN HOUSEHOLD-MEMBERS EXPOSED TO
PERSONS WITH TYPE 80/81 STAPHYLOCOCCAL DISEASE

Community	Persons at Risk	Secondary Case	Secondary Attack Rate
Cincinnati	914	82	9%
Toledo	224	29	13%
Lima	71	9	13%
Dayton	38	7	18%
TOTAL	1,247	127	10%

(Reported in Disease Control Information, May 18, 1962, published by the Ohio Department of Health.)

INTERNATIONAL NOTES - QUARANTINE MEASURES

No report.

Notes: These provisional data are based on weekly telegrams to the Communicable Disease Center by the individual State health departments.
